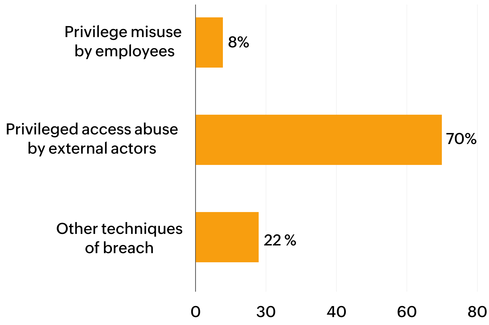
Application Control Plus

Are excessive **admin rights** causing organizations more harm than they realize?

Breach techniques **2020**



In 2020, abuse of admin rights and similar privileges was the top reason behind breaches.

58 percent of all Critical Microsoft vulnerabilities that were found in 2020 could be mitigated by removing admin rights.

Removing admin rights would mitigate 70 percent of Critical vulnerabilities affecting Windows 7, RT, 8, 8.1, and 10.

But how can organizations get rid of admin rights without taking away privileges from employees whose job requires them?

It's easy! Adopt this simple three-part strategy.

Principle **o**f **l**east **p**rivilege **+**

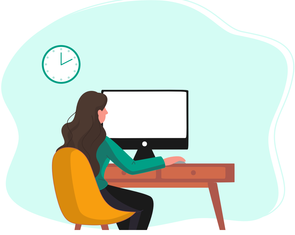
Lower enterprise-wide privileges to the bare minimum required. Identify and remove unnecessary local admin accounts.

Endpoint **p**rivilege **m**anagement **+**

Elevate application-specific privileges instead of user privileges, and associate these rights to necessary end-user device groups.

Just-**i**n-**t**ime access

Cater to temporary needs of employees without creating permanent policies. Strike the perfect balance between security and productivity.



Application Control Plus is a silver bullet that seamlessly combines these three capabilities.

What's more? This software also offers integrated application control features that enable trust-based filtering and restriction of applications that are allowed to execute, ensuring that only authorized access is granted to network resources.

Application Control Plus acts as a multifaceted engine that enables organizations of all sizes and modes of operation to tailor a fortified foundation based on powerful security principles like Zero Trust and the principle of least privilege.
